

Press release

HÖRMANN Intralogistics receives order from Innviertel company to implement an AutoStore system

With this project, the company aims to further automate its intralogistics at the site and increase efficiency in warehousing. The order includes the construction of an AutoStore grid (single-double) with 12,700 containers for machine components with a height of 220 mm. A total of 18 "Red Line" robots and 14 loading stations ensure a continuous material flow and enable an output of 70 storage and 620 retrieval per hour. Five carousel ports will be installed as workstations.

In addition, numerous safety and infrastructure equipment is included, including a fire extinguishing and service platform, aerosol capsules, fire protection walls and a robotic cleaning station. Pick-by-light systems on the carousel ports support almost error-free order picking. The robots are painted in the special customer color to fit perfectly into the corporate design. In addition, two picking trolley jacks are provided for efficient material transport.

"With the AutoStore system from HÖRMANN Intralogistics, we are taking a significant step towards automating and optimizing our warehouse processes. The new system enables us to significantly increase efficiency, shorten access times and improve inventory transparency," comments the Inviertel company on the implementation and emphasizes: "The cooperation with HÖRMANN Intralogistics puts us in a position to meet the increasing demands for flexibility and speed in mechanical and plant engineering. The new AutoStore system will create a future-oriented basis for the continuous development of intralogistics at the site."
